

Free QR Code Generator

Generate a shareable QR code

Open this tool: leadai.itforall.org/qr-generator.php

Access and scope

This tool is public and needs no login. It creates static QR codes in your browser. It does not create event entitlements or check payment; use QR Tickets for a controlled event-entry workflow.

1. Choose a content type

Select website URL, WhatsApp, email, phone, UPI, plain text or contact card. Fill only the fields for that type. For WhatsApp use the correct international phone number and review the prepared message.

2. Check the destination

For a website, include the full <https://> address. For UPI, carefully verify the payee ID, name and amount. A UPI QR opens a payment request; it does not confirm that money was paid.

3. Set the design

Choose a size, quiet margin, error-correction level and colours. Use a dark code on a light background with a clear margin. Avoid decorative low-contrast combinations.

4. Generate and download

Generate the preview, review the displayed QR value, then download PNG or SVG. Use PNG for ordinary sharing and SVG when scalable vector artwork is suitable for your print workflow.

5. Scan before publishing

Scan the downloaded file on a second phone. Check the real recipient, link or payment details. Test a printed sample at its final size before ordering large quantities.

Free QR Code Generator

Use and troubleshoot

QR does not scan

Increase the size, restore a clear quiet margin and use stronger colour contrast. Shorten very long content. Avoid blurred screenshots, cropping or placing the code across folds.

Wrong destination

Correct the original inputs and generate a new QR. A static QR encodes its original value; changing the portal fields later does not update files already downloaded or printed.

WhatsApp or payment app opens

The QR prepares the relevant action. The person scanning must still review and send the WhatsApp message or authorise the payment. Do not treat a scan as a completed transaction.

Privacy

Do not encode passwords, staff PINs or private lead records. Anyone with the image can read its contents. Browser-local generation does not make the printed result private.

Need event passes?

Use the QR Tickets page to generate a Google Sheets coupon/pass workflow with approval and redemption tracking. A generic QR containing a ticket number cannot by itself prevent repeated entry.

Support

Contact support@itforall.org with the QR type, browser and a non-sensitive test value. Include the downloaded image only if it contains no private information.
